

Elevated Slip/Trip Incidents at Depot A

Issued by: Brian Nyamu, HSE Analytics | Distribution: Depot A site leadership, all shift supervisors

What we're seeing

Depot A has logged more Slip/Trip incidents than any other site or incident type combination in our network – 55 recorded over the past year, well above the same category at every other site. This isn't a one-off cluster; it's the single largest pattern in the whole safety dataset. That tells us something at Depot A specifically – not the network as a whole – is making people more likely to slip or trip on the job.

Why this matters now

Slip and trip incidents are usually treated as minor, but they're also the easiest incidents to prevent – and the ones most likely to escalate into a serious injury if the underlying cause (wet flooring, poor lighting, clutter, damaged walkways) isn't fixed. We'd rather flag this loudly now, while it's still a pattern of near-misses and minor injuries, than wait for it to become a serious one.

What we need you to do

- **This week:** Walk the Depot A floor and yard with your shift team and flag every wet surface, uneven walkway, loose cable, or blocked walkway you find – even ones that seem minor.
- **This week:** Confirm anti-slip mats and warning signage are in place at all known wet-process areas (wash bays, loading points, spill-prone equipment).
- **Ongoing:** Remind your team at the next toolbox talk – report a hazard the moment you see it, don't wait for the next scheduled inspection.
- **Within 2 weeks:** Site leadership to review lighting and walkway conditions in the areas where incidents have clustered and log any repairs needed.

Questions or something to report?

If you see a hazard, report it immediately – don't wait for this alert to prompt you again.

Thank you for taking this seriously – catching this pattern early is exactly how we keep it from becoming someone's injury.
